It means "square root". The square root is actually a fractional index and is equivalent to raising a number to the power $1/2$. So, for example: $25^{(1/2)} = \sqrt{25} = 5$ You can also have. Cube root: $\sqrt[3]{x}$ (which is equivalent to raising to the power $1/3$), and. Fourth root: $\sqrt[4]{x}$ (power $1/4$) and so on. See more at Fractional Exponents.

Exponent is the number of times a number is multiplied by itself.Exponents are written as x^y ; where x is the number and y is the exponent or power. Example: $2 * 2 * 2 * 2 * 2 = 2^5$ The n th root of a number x is a number r which, when raised to the power of n , equals x . i.e $r^n = x$ In the above example $2^5 = 32$, hence 2 is the 5th root of 32. Powers and Roots Revised @2009 MLC Page 2 of 7 Square Roots The mathematical symbol for square root is $\sqrt{\quad}$ To find the square root of 25 look for a number that when multiplied by itself will result in 25. Therefore the square root of 25 is 5 because 5×5 is 25. $25 = 5^2$ Ex. $16 = 4^2$ $9 = 3^2$ $4 = 2^2$ $100 = 10^2$ $49 = 7^2$

Note, however, that most higher roots don't yield integers, and many don't even produce rational numbers. Combining powers and roots . The unit fraction notation used for roots previously may have given you the idea that roots are really the same as powers, only with a unit fraction (one over some number) instead of an integer as the exponent.
